

DEPILPLUS3

ELECTRICAL EPILATION

Three epilation systems in one device

- Thermolysis
- Electrolysis
- Blend.

THE LATEST FOR WHITE & FINE HAIR REMOVAL

The energy is channelled through a delicate needle, which is inserted through the follicle until it reaches the root where the electrical discharge is applied, causing irreversible damage to the hair germinal cells, thus eliminating the possibility of the growth of a new hair.

Technique	Emission	Action
Electrolysis	Galvanic	Destruction of the dermal papilla by (alkaline) chemical burn.
Thermolysis	High frequency	Destruction of the dermal papilla by thermal action.
Blend system	Galvanic + High frequency	Combined action of electrolysis and thermolysis.

ELECTRICAL EPILATION

**Definitive
removal of all
unwanted
body hair**

Facial and body epilation

DEPILPLUS 3 is the electro-aesthetic equipment, which includes the three most effective techniques in electric hair removal: thermolysis, electrolysis and the combination of both (blend system).

Electric hair removal is the only technique that guarantees the elimination of all non-desired hair regardless of its colour, thickness or location. This technology works with controlled emissions of galvanic and high frequency currents. It is recommended for small areas, residual hair after photoepilation or in cases where traditional hair removal is not possible.
